(a) Lorenz-63, 3 seeds
gap to ensemble rule (accuracy)
training samples n
1-NN
k-NN, $k = \lceil \sqrt{n} \rceil$
$L = 1$
$L = 3$
1-NN floor
(b) threshold crossings
$\log_{10} n^*$ (gap ≤ 0.05)
none
horizon in Lyapunov times L
Lorenz-63
Rössler
Lorenz-96, N=5
Lorenz-96, N=6
Lorenz-96, N=8
1-NN (filled)
k-NN (open)
extrapolated
not identifiable
(c) rate depends on the learner
γ_L (interpolated crossings)
$\gamma_L = D_2$
1-NN, per seed
k-NN, per seed
correlation dimension D_2 (range over estimators)
